If your IKEv1, or even SSL, configuration already exists, the ASA makes the migration process simple. On the command line, enter the migrate command:

migrate {l2l | remote-access {ikev2 | ssl} | overwrite} Things of note:

Keyword definitions:

I2I - This converts current IKEv1 I2I tunnels to IKEv2.

remote access - This converts the remote access configuration. You can convert either the IKEv1 or the SSL tunnel groups to IKEv2.

overwrite - If you have a IKEv2 configuration that you wish to overwrite, then this keyword converts the current IKEv1 configuration and removes the superfluous IKEv2 configuration.

A remote client must download a small, Java-based applet for secure access of TCP applications that use static port numbers. UDP is not supported. Examples include access to POP3, SMTP, IMAP, SSH, and Telnet. The user needs local administrative privileges because changes are made to files on the local machine. This method of SSL VPN does not work with applications that use dynamic port assignments, for example, several FTP applications.
